Abstract

In August 2004, HP produced new Microsoft® Exchange MAPI Messaging Benchmark (MMB3) results using Microsoft Windows® Server 2003 and Microsoft Exchange Server 2003, on an HP ProLiant DL360 G4 server powered by two Intel® Xeon™ processors (3.4GHz/800MHz/1MB L2). The MMB3 benchmarking workload and methodology serves as the standard for Exchange Server 2003 MAPI server comparison. The MMB3 workload is characteristic of a medium corporate mail environment. Using the Microsoft LoadSim utility, the ProLiant DL360 G4 server was tested at the HP Performance Center in Nashua, New Hampshire.

Executive summary

HP achieved world-class Microsoft Exchange Server 2003 scalability results of 6,500 MMB3 on a ProLiant DL360 G4 server equipped with:

- Two Intel Xeon processors (3.4GHz/800MHz, 1MB L2)
- 56 – 36.4 GB hard drives on one Smart Array 6402 controllers for databases.
- 28 – 36.4 GB hard drives with one KGPSA Fibre Channel Host Bus Adapter
- One – 36.4 GB hard disk drive for Active Directory and pagefiles
- One – 36.4 GB hard disk drive for the Exchange files, operating systems

The ProLiant DL360 G4 (dual processor) server achieved the following:

- Average CPU utilization rate of 85% during the 6,500 MMB3 test
- Weighted 95th percentile response-time score was 748 milliseconds
- Average send-queue size for the four-hour steady-state period was 106 messages

ProLiant DL360 G4 – the server behind the outstanding performance

Overview

The new ProLiant DL360 G4 is a 1U, two processor capable, two PCI-X slot, two disk drive server with Integrated Light-Out (iLO) management.

New ProLiant DL360 G4 server models:

- Intel Xeon 3.4GHz/800MHz processor and 1MB L2 cache
- Intel Xeon 3.0GHz/800MHz processor and 1MB L2 cache

Figure 1. HP ProLiant DL360 G4 server

ProLiant DL360 G4 server features

- Intel Xeon 3.4 GHz processors with EM64T, a 800MHz front side bus and 1MB of L2 cache (two 3.4GHz or 3.0GHz)
- Intel E7520 chipset
- Two 64 bit/133 MHz PCI-X slots (one full length slot and one half length); optional PCI-Express. **Note:** For information about PCI Express visit: http://www.hp.com/servers/pci-express
- 1GB or 2GB (depending on model) of 2-way interleaved PC2700 DDR SDRAM at 333 MHz memory. Up to 8GB maximum
- Embedded HP Smart Array 6i Ultra320 RAID controller
- Embedded NC7782 Dual Port NIC
- 1.44-MB diskette drive
- USB ports (3)
- Maximum internal storage of 600 GB SCSI (2x300 GB SCSI) or 500 GB (2x250 GB serial ATA)
- Support for new integrated Lights-Out (iLO) Shared Network Port enables access to the iLO management processor through one of the embedded system NICs

Smart Array 6402 controllers

Description

The Smart Array 6402 high performance Ultra320, PCI-X array controller, as shown in Figure 2, provides maximum performance, flexibility, and reliable data protection for HP ProLiant servers, through its unique modular design and support for Advanced Data Guarding (RAID ADG). This new generation performance Smart Array controller again raises the standards of performance, introducing Double Data Rate (DDR) battery-backed write cache (BBWC) architecture and a new RAID engine. Designed and tested with industry standard HP ProLiant servers for greater reliability, this controller is ideal for workgroup and departmental servers. And, like other Smart Array controllers, the Smart Array 6402 controller features complete data compatibility with previous generation's Smart Array controllers for easy data migration from server to server and for controller upgradeability.

Figure 2. Smart Array 6402 controller

Smart Array 6402 controller features

- Modular, easy to upgrade design lets you optimize performance and increase capacity as needed from 128 to 256 MB battery-backed cache (BBWC). Increase capacity as needed from two to four channels with the U320 expansion option.
- High performance, sixth-generation architecture offers a new hardware RAID engine and a new performance 266 MHz DDR memory architecture for increased performance over previous controllers.
- Recovery ROM protects against a ROM failure or corruption.
- Ultra320 SCSI technology delivers high performance and data bandwidth up to 320 MB/s bandwidth per channel.
- Mix and match LVD SCSI compatibility protects your investments and lets you deploy drives as needed.
- BBWC protects cached data in the event of a power outage, server failure or controller failure, and redundant, replaceable batteries take that protection even further. Maximum cache configuration is 256 MB of BBWC.
- 64 bit, 133 MHz PCI-X interface boosts bandwidth above 1 GB/s burst transfer rate over PCI-X bus.
- 64 bit memory addressing supports servers with greater than 4 GB of memory.
- Online management features:
  - Online Capacity Expansion
  - Online RAID Level Migration
  - Online Stripe Size Migration
  - Multiple Online Spares (Global)
  - User Selectable Read/Write cache
  - User Selectable Expand and Rebuild Priority

FCA 2101 StorageWorks PCI-to-Fibre Channel Host Bus Adapter

Description

FCA 2101 StorageWorks 2GB, Fibre Channel Host Bus Adapter is a single channel, 64bit/66MHz PCI to Fibre Channel Host Bus Adapter (HBA), as shown in Figure 3.

Figure 3. FCA 2101 PCI-to-Fibre Channel Host Bus Adapter

FCA 2101 features

- Operating system support split between two HBAs, one supporting x86 NT environments and the other HBA supporting Tru64 and OpenVMS operating environments
- Embedded physical interface requires no GBICs to purchase
- 64-bit PCI data and addressing
- Hardware context cache for superior fabric performance
- Full fabric support using F_Port and FL_port connections
- Support for concurrent use of multiple protocols (FC/SCSI)
- Full support for both FC service Class 2 and 3
- Support FC-Tape (FC-2) devises
- End-to-end parity protection for high data integrity
- Buffered data architecture to support up to 500m cabling

StorageWorks MSA1000

Description

The HP StorageWorks Modular Smart Array 1000 (MSA1000) as shown in Figure 4, is a 2 Gb Fibre Channel storage system for the entry-level to midrange storage area network (SAN). It provides the customer with a low-cost, scalable, high performance storage consolidation system with investment protection. It is designed to reduce the complexity and risk of SAN deployments. The powerful but easy to use management software makes it ideal for departmental and remote location SANs. With the addition of two more drive enclosures, it can control up to 42 drives allowing capacity of six terabytes. All configuration, management and partitioning and licensing software come standard with no extra charges.

Figure 4. StorageWorks MSA1000

StorageWorks MSA1000 features

- Flexible: supports Windows Server 2003 (32 & 64-bit), Windows 2000 and NT, NetWare, Linux (32 & 64-bit), Tru64 UNIX. OpenVMS, or HP-UX operating systems
- Performance: provides transmission rate of up to 30K I/Ops (cache), throughput of up to 200 MB per second
- Compatible: supports 14 1-inch drives, 1 or 2 Gb Fabric Switches or hubs, in a 4U rack space
- Scalable: is easily expanded to 6 TB using forty-two 146 GB hard drives in 10U of rack space
- Integrated: allows installation of an optional internal MSA 8-port switch or an MSA 3-port hub
- Serviceable: supports hot plug drives, controllers, fans, power supplies, switches and hubs
- Reliable: supports the highest level of fault tolerance (RAID ADG)

Test methodology and workload

For Microsoft Exchange Server 2003, the benchmarks were measured using the MAPI Messaging Benchmark 3 (MMB3).

The MMB3 workload, for LoadSim 2003, is a modification of the previous MMB2 workload. It is designed to include new features from Microsoft Exchange Server 2003 and Microsoft Outlook 2003. This workload achieves the following:

- Uses the Microsoft Outlook 2003 client
- Introduces Smart Folders
- Introduces the use of server-side rules
- Allows the message distribution to be composed of a larger message size than MMB2
- Increases the mailbox size to 100MB per user
- Removes journaling from the benchmark

For more detailed information regarding the differences between MMB2 and MMB3, please refer to Appendix C – MMB2 and MMB3 workload comparison in this document.

This test measures the messaging throughput of a single server, single site topology. Its purpose is to measure the maximum throughput of a Microsoft Exchange Server on this hardware configuration.

Note: This test can provide a benchmark for comparing hardware and/or software products, but cannot be used as a deployment guide for production environments. For deployment specific information, visit http://www.hp.com/solutions/exchange.

The MMB3 benchmark does not account for:

- Usage profiles not matching that of the LoadSim MMB3 profile
- Per user storage, and per server backup requirements
- Fault tolerance requirements, such as protected storage (RAID 0+1, RAID 5) for the system/page file volume, information store and transaction logs
- Anti-virus and management processes and effects on the server
- UBE/UCE (spam) mail flow
- Workloads other than MAPI private folder access. This includes Public Folder, NNTP, POP3 and other email interfaces
- Multiple Exchange Server deployments, where additional resources are required to forward mail intra-site
- Connectors, Links and Replication to remote Exchange sites
- Network topologies, bandwidth availability, latency requirement and SLA related factors like QOS (Quality of Service) and fail-over path issues
- Manageable database sizes and partitioning beyond the 2 Storage Group, 2 database/SG configuration

Test result highlights

Hewlett Packard	
Server:	HP ProLiant DL360 G4
Test results	
MMB3 score:	6,500
Response time:	748 ms
CPU utilization:	85%
Avg. queue:	106
Msgs. submitted	274,493(4-hour steady state period)
Msgs. delivered	682,761 (4-hour steady state period)
Msgs. sent	274,319 (4-hour steady state period)
Server configuration	
CPU:	Intel Xeon 3.4 Gigahertz (GHz) / 800MHz
CPU count:	2 Physical
RAM:	4 Gigabytes (GB)
Secondary cache:	1 MB L2 Cache
Operating system:	Microsoft Windows Server 2003 Enterprise Edition
Storage:	56 – 36.4 GB – Information Store and transaction 28 – 36.4 GB – log files 1 – 36.4 GB – Operating system, Exchange files 1 – 36.4 GB – page files and Active Directory
Controller:	1 – HP Smart Array 6402 controllers 1 – FCA 2101 PCI-to-Fibre Channel Host Bus Adapter
NIC:	ProLiant NC7782 Gigabit Server Adapter

Note: Complete disclosure of test results can be found on the Microsoft Exchange Server 2003 Performance Scalability website:

http://www.microsoft.com/exchange/evaluation/performance/default.asp

Appendix A – Detailed test results

Descriptive terms

Messages Submitted – Submitted calls made by clients. This equates to total messages sent by users.

Messages Sent – Messages that the Store sends to the categorizer in Inetinfo (SMTP Service in particular).

Note: All messages – even MAPI messages – are sent to the categorizer, as this replaces the MTA for all but communication via X.400, with a Microsoft Exchange 5.5 server.

Message Recipients Delivered – Separate mailboxes where messages have been delivered.

Message Opens/Sec – Messages accessed for reading per second.

Folder Opens/Sec – Folders opened for browsing per second.

RPC Read Bytes/Sec – Bytes read from clients, sent via RPCs.

RPC Write Bytes/Sec – Bytes written to clients, sent via RPCs.

IS Send Queue Average Length – Send Queue Size is the number of messages in the private information store's send queue.

Test results

Table 1. Test results

Summary	
Supported Benchmark Load	6,500 MMB3s
Benchmark Profile	MAPI Messaging Benchmark 3 (MMB3)
Protocol	Exchange MAPI
Length of Steady State	4 Hours
Length of Test	8 Hours
Category	Single Server
Unless otherwise noted, values listed below are averages over entire 4-hour steady state period.	
Transactions in total	
Total Messages Submitted	274,493
Total Message Recipients Delivered	682,761
Total Messages Sent	274,319
Ratio Message Recipients Delivered / Messages Submitted	2.49
Transaction Load (per hour)	
Messages Submitted / hour	68,623
Message Recipients Delivered / hour	170,690
Messages Sent / hour	68,580
Transaction Load (per Second)	
Message Opens/Sec	74
Folder Opens/Sec	25
RPC Read Bytes/Sec	218,454
RPC Write Bytes/Sec	3,875,941
Transaction Queues	
IS Send Queue Average Length	106

Network Controller	NC3163 Fast Ethernet NIC
Operating System	Windows XP Professional

Appendix B – LoadSim changes from previous version

- New user profile – In the Test Properties dialog box of LoadSim 2003, there is a "Cached Mode" profile. The "Cached Mode" profile is an example of which tasks should be enabled to simulate a cached mode user.
- RPC/HTTP– LoadSim 2003 allows simulation of RPC/HTTP deployments in its entirety. You can use the Test/Logon tab to configure your RPC/HTTP settings, including SSL encryption.
- Outlook 2003 specific tasks – In LoadSim 2003, you can use the new "Smart Folders", "Offline Address Book", "Synchronize Folders" tasks to better simulate real-life users.
- Dynamic Distribution Lists – In Topology Properties dialog box of LoadSim 2003, there is a "Dynamic Distribution List" (DDL, also known as Query-Based Distribution Group) group of settings that allow the creation of DDLs. The "Send Mail" task also allows sending mail to DDLs with a desired frequency.
- Rules – In LoadSim 2003, you can populate users with server-side rules and simulate how users create and delete them over time. All LoadSim-created rules are visible and capable of being manipulated by Outlook.
- Profile improvements – The medium and heavy profiles have enhanced simulation capabilities that are disabled by default in MMB2. These improvements include keeping messages open and loading message properties in a consistent manner with Outlook 2003.

Appendix C – MMB2 and MMB3 workload comparison

Table 6. Topology properties

Topology properties	MMB2	MMB3
Security		
Use a separate account for each Exchange user	No	Yes
Use one account for all Exchange users	Yes	Not Tested
Credentials		
Logon to users using their respective accounts	No	No
Distribution Lists		
Use Distribution Lists	Yes	Yes
Number of Distribution Lists per site	100	1000
Distribution List minimum/average/maximum	2/10/20	2/10/20
Dynamic Distribution Lists (DDLs)		
Use DDLs	No	No
Create one for all LoadSim Users	No	No
Create one per MDB	No	No
